Full-stack engineer building and operating production web platforms end to end — payments, auth, and self-hosted infrastructure.

Languages: Spanish (native) · English (B2)

EXPERIENCE

Independent Software Engineer — Contract *Sep 2024 – Present*

SaaS product client (name withheld by client request) *Jun 2026 – Present*

- Own a multi-tenant Next.js/Postgres platform end to end: shared-database tenancy enforced fail-closed by a Prisma extension (a query without tenant context throws), per-tenant encryption keys, per-host authentication on tenant custom domains connected in one click via Domain Connect, and nested, separately branded sub-tenants with delegated resource grants.
- Built the auth stack (passkeys, TOTP, email OTP), organization-scoped RBAC with custom access control over 18 resources and dynamic roles, and a support-ticket system with SLA policies and round-robin assignment.
- Built runtime-configurable i18n and push notifications with delivery tracking; built an idempotent, batched importer from a legacy Laravel/MySQL system (decrypting its encrypted fields, upgrading password hashes at sign-in) and folded a second production deployment into the platform as a tenant.
- Backed by 500+ unit test files, 139 Playwright specs in 3 CI shards, architecture-invariant tests, and 110+ written ADRs; deployed on self-hosted infrastructure.
- Built a self-hosted 3-container CI runner fleet after exhausting hosted CI quota, with a written architecture comparison and a one-command rollback.
- Diagnosed and fixed two production incidents: a silent CI/deploy pipeline divergence, and a database misconfiguration that exposed internal tables past application-level authorization. SSRF-hardened outbound requests (DNS-pin-then-connect, private-range blocking).

TuMenuDigital (tumenudigital.mx) — restaurant operations platform (POS, kitchen display, WhatsApp CRM)
Mar – Jun 2026

- Shipped 90+ merged pull requests over 3 months against a ticketed backlog, in a framework new to me, under peer code review.
- Built point-of-sale and thermal-receipt features (split billing, shift management, WhatsApp receipt delivery) and kitchen-display-system improvements (sound alerts, prep-time analytics, order-state sync).
- Hardened authentication: dual-channel OTP (WhatsApp + email), closed an account-existence leak in error messages, moved sensitive endpoints behind server-side authorization checks.
- Implemented plan-limit enforcement and paywall gating across billing tiers.

Multi-business group (healthcare, telecom services — Venezuela; client relationship ended) *Sep 2024 – Sep 2026*

- Built a payment-reconciliation system against a national bank's B2B API: timezone-aware parsing, idempotent duplicate detection, full webhook audit logging.
- Implemented a multi-tenant backend-for-frontend serving 3 businesses with per-tenant secret isolation.
- Built a document pipeline for clinical PDFs: geometric layout detection via the render transform matrix, in-place editing, fuzzy recipient matching, idempotent bulk email delivery.
- Shipped a browser extension automating a spreadsheet-export-to-API sync with bulk upsert/diff and an early-stop circuit breaker.

Independent web-service clients (6 separate businesses, one deployment each) *Sep 2024 – Present*

- Built and maintained a multi-client email-processing backend over a shared IMAP inbox: multilingual regex extraction (5 languages), request queueing, constant-time API-key auth.

- Propagated a coordinated security and caching hardening pass across every live tenant deployment in a single-day rollout.

Automation backend for account-management clients *Jun 2026 – Present*

- Integrated 4 undocumented private APIs to automate account operations for a small set of paying clients.
- Run a geo-aware proxy pool with per-node cooldown and health tracking.
- Diagnosed and fixed a production race condition and memory leak in the pooled transport cache.

PROJECTS

JSON Flow (json-flow.com) — VS Code extension, 75,000+ installs

Open-source collaboration. Built the marketing site end to end (Astro, React, Tailwind) — every section from hero to footer. Contributed to the extension's React webview: shadcn/ui migration, theming, a settings dialog with persistence, layout/orientation state. Credited by name on the project's site.

Snug — snug.andryore.dev · github.com/AndryOre/snug

Browser extension to export, import and back up bookmarks in six formats, with scheduled auto-export to a folder of your choice; everything stays on-device. 5,000 users and a 4.8/5 rating on the Chrome Web Store, plus ~740 on Microsoft Edge Add-ons. MIT-licensed, 40 stars, one external contributor merged.

claude-forge — multi-agent orchestration CLI

Concurrency limits derived from cgroup v2 resource limits, race-free cross-repo slot locking, a dependency gate that fails closed.

SKILLS

Primary stack: TypeScript · React / Next.js · Node & Bun · PostgreSQL + Prisma · Tailwind

- **Backend & data:** Hono · REST API design · PostgreSQL · Prisma · webhook processing
- **Auth & security:** Better Auth · RBAC · WebAuthn/passkeys/TOTP · SSRF hardening
- **Infrastructure:** Docker Compose · Coolify (self-hosted PaaS) · GitHub Actions · self-hosted CI
- **Frontend:** React · Next.js · Astro · Tailwind · shadcn/ui · TanStack Table
- **Tools:** Git · Playwright · Bun test

AI-assisted development (spec-driven): Claude Code in daily production workflow — reviewed and verified, not accepted.
